ALCOLOCK™ LR With GPS and Wi-Fi

Alcohol Interlock

Technical Specifications

12/24 Volt Model

Overview

The ALCOLOCK series of alcohol interlocks are devices which are intended to prevent in the blocked state the starting of a motor vehicle, and which can be brought into the unblocked state only after presenting and analyzing a breath sample with an alcohol concentration below a set value. It consists of a handset and a control unit electrically connected to the vehicle.

The ALCOLOCK alcohol interlock only prevents the starting of the vehicle; it does not influence a running vehicle motor.

The installation of the ALCOLOCK alcohol interlock requires connection to vehicle +12V or +24V, vehicle ground, monitoring of either the ignition switch or tachometer signal or both, and the interruption of the starter wire.

After presenting a proper breath sample the ALCOLOCK alcohol interlock will close a set of relay contacts that allow the vehicle motor to start. The ALCOLOCK alcohol interlock starter relay shall stay closed until after the vehicle motor and ignition switch has been turned off plus a preprogrammed restart period. The restart period does not require a new breath sample and is typically programmed between 3 and 60 minutes.

This version of the ALCOLOCK LR alcohol interlock includes a GPS module that logs the coordinates of the vehicle where the device is mounted and a Wi-Fi module to ease the logs transfer during a service appointment.
